OpenAPI python generator is a modern way to generate clients for OpenAPI 3.0.0+ APIs. It provides a full Client, including pydantic models (providing type-safe data structures) and multiple supported frameworks.

The key features of the generator are:

- Ease of **use**. Provide input, output and the library, and the generator will do the rest.
- Type safety and type hinting. OpenAPI python **generator** makes heavy use of pydantic models to provide type-safe data structures.
- **Support for multiple rest frameworks.** OpenAPI python **generator** currently supports the following:
 - [httpx](https://pypi.org/project/httpx/)
 - [requests](https://pypi.org/project/requests/)
- Async and sync code generation **support**, depending on the framework. It will automatically create both for frameworks that support both.
- Easily extendable using Jinja2 **templates**. The code is designed to be easily extendable and should support even more languages and frameworks in the future.
- **Fully tested**. Every generated code is automatically tested against the OpenAPI spec and we have 100% coverage.
- Usage as CLI or as **library**.
